SAY HI ON LINKEDIN

✂ 01. THE LETTER
Hello team,
I'm Ikrame. I started in operations, close to people, teams, and work that had to land every day. That's where I learned to watch the details: the missing information, the steps that get repeated, the mess that grows because nobody had time to sort it.
When I found development, I knew I wanted the other side of that: the tools, the processes, and the systems that make the work a bit clearer for whoever comes next. It wasn't an overnight switch. I learned, I built projects, I broke things and put them back together until programming stopped being something I studied and became how I solve problems.
Today I work mostly on backends. I like to understand before I build. What the person using the system needs, what can go wrong, and which decision should stay human. I use AI when it actually helps, but I still want the code to stay readable, the data to be validated, and someone to be able to review what happened.
I'm fairly meticulous about my work. I like leaving things thought through, documented, and tested. I also like keeping up. This academic year I'm starting the vocational master's (máster de FP) in AI and big data, fully online, while I prepare GCP and AWS cloud certifications.
My projects tell the technical side. This letter tells the other: I care about useful software, with attention to the detail and to the person who will use it.
Best,
<i>Ikrame Ibn Hayoun</i>

✂

01. RECKONFLOW

The technical proof

FastAPI, PostgreSQL, Redis, Decimal ledger. Row locks (FOR UPDATE) and Redis idempotency so a retried confirm cannot double-post. pytest in CI.

02. JUDGMENT

The model extracts.
Code decides.

Closed schema, extra=forbid. Validation in code before any database write. The LLM has no authority to approve payouts or change business rules.

03. DELIVERY

What I ship has to hold

GitHub Actions, Docker, Prometheus. Validata uses Celery for bulk jobs. The CLI and the skill are packages you can install, not product APIs.
